AIM: I1 Extends I2 (I-Interface)

Steps for Execution:

1. Create a folder named assignment.
2. Create a Java file inside it:

   I1extends I2 .java
3. Write/save the program in the file.
4. Open the Eclipse IDE.
5. Compile the program.
6. Run the program.
7. Output:

   I2 method

   I1 method

Algorithm:

1. Start.
2. Create interface **I2** with method add().
3. Create interface **I1** that extends **I2**.
4. Add method add1() in interface I1.
5. Create class **Show** that implements I1.
6. Define add() method in Show.
7. Define add1() method in Show.
8. Create an object s of Show class.
9. Call s.add().
10. Call s.add1().
11. Display the results.
12. Stop.

Program:

```
package myprogs;
// I2 is an interface
interface I2 {
 // Method declared for I2 interface
   void add();
```

```
}
//I1 extends I2
// So I1 inherits the add() method from I2
interface I1 extends I2 {
// Method declared for I1 interface
  void add1();
}
// Show class implements I1 interface
// So Show must implement both add() and add1()
class Show {
@Override
  // Implementation of add() method from I2
  public void add() {
    System.out.println("I2 method");
  }
@Override
  // Implementation of add1() method from I1
  public void add1() {
    System.out.println("I1 method");
  }
}
// Main class
public class I1ExtI2 {
public static void main(String[] args) {
// Creating an object of Show class
    Show s = new Show();
 // Calling add() method
    s.add();
 // Calling add1() method
    s.add1();
  }
```

}

Output:

I2 method

I1 method

Output Screenshot:
