

AIM: I1 Implements C1(I-Interface,C-Class)

Steps for Execution:

1. Create a folder named assignment.
2. Create a Java file inside it:

I1 extends I2 .java
3. Write/save the program in the file.
4. Open the Eclipse IDE.
5. Compile the program.
6. Run the program.
7. Try to compile/run the program.
8. The program itself has no main() method, so it cannot be executed as a Java application.
9. More importantly, if you actually write interface I1 implements C1, the compiler will give an error.

Algorithm:

1. Start.
2. Create a class C1.
3. Define the show() method inside C1.
4. Create an interface I1ImplC1.
5. Declare the show1() method inside the interface.
6. Try to establish a relationship where an interface implements a class.
7. Java does not allow an interface to implement a class.
8. Therefore, this relationship is not applicable.
9. Stop.

Program:

```
package implement;  
  
// C1 is a class  
class C1 {  
  
    // Method of C1 class  
  
    void show() {  
  
        System.out.println("C1 method");  
    }  
}
```

```
}
```

```
}
```

```
// I1 is an interface
```

```
// An interface cannot implement a class
```

```
// Therefore, this code does NOT create the relationship I1 implements C1
```

```
public interface I1ImplC1 {
```

```
// Method declared inside the interface
```

```
    void show1();
```

```
}
```

NOTE: There is no output here ,because an interface cannot implement a class.
