

AIM: C1Extends C2,C3(C-class,I-Interface)

Steps for execution:

1. Create a folder named assignment.
2. Create a Java file inside it:
`C1Extends C2,C3 .java`
3. Write/save the program in the file.
4. Open the Eclipse IDE.
5. Compile the program.
6. Run the program.
7. The code as currently written can be **compiled**, because the invalid C1 declaration is commented out.
8. However, it cannot be run as a Java application because there is **no main() method**.
9. The compiler will show an error.

Algorithm:

1. Start.
2. Create class **C2**.
3. Define the displayC2() method inside C2.
4. Create class **C3**.
5. Define the displayC3() method inside C3.
6. Try to create class **C1** by extending both C2 and C3.
7. Java does not support multiple inheritance using classes.
8. Therefore, C1 extends C2, C3 is not applicable.
9. Stop.

Program:

```
package typesofarray;  
  
// C2 is a class  
class C2 {  
  
    // Method of C2 class  
    void displayC2() {  
        System.out.println("This is C2");  
    }  
}
```

```
}  
  
// C3 is another class  
  
class C3 {  
    // Method of C3 class  
  
    void displayC3() {  
        System.out.println("This is C3");  
    }  
}  
  
// Multiple inheritance using classes is NOT allowed in Java  
  
// C1 cannot extend both C2 and C3  
  
// class C1 extends C2, C3 {  
  
// }
```

NOTE: There is no output here,because C1 does not extends C2,C3.
