

1. Aim:

To write and execute a Java program to demonstrate Class 1 Extends Class2.

Steps for Execution:

1. Create a folder named assignment.
2. Create a Java file inside it:

C1ExtendsC2.java
3. Write/save the program in the file.
4. Open the Eclipse IDE.
5. Compile the program:
6. Run the program:
7. **Output:**
8. This is Class2.

This is Class1.

4. Algorithm

Step 1: Start the program.

Step 2: Create a class Class2 with a method display().

Step 3: Create a class Class1 that extends Class2.

Step 4: Define a method show() inside Class1.

Step 5: Create the main class C1ExtendsC2.

Step 6: Create an object object of Class1.

Step 7: Call display() using obj.

Step 8: Call show() using obj.

Step 9: Display the output.

Step 10: Stop the program.

Program:

```
package assignment;
```

```
// Parent class
```

```
class Class2 {
```

```
// Method for Class2
```

```
void display() {
```

```
    System.out.println("This is Class2.")
```

```

    }
}
// Child class inherits Class2
class Class1 extends Class2 {
    // Method for Class1
    void show() {
        System.out.println("This is Class1.");
    }
}
// Main class
public class C1ExtendsC2 {
    // Main method:
    public static void main(String[] args) {
        // Creating an object for Class1
        Class1 obj = new Class1();
        // Calling the inherited method from Class2
        obj.display();
        // Calling the own method for Class1
        obj.show();
    }
}

```

Output:

This is Class2.

This is Class1

Output Screenshot:
